Bladder Care Postpartum and Management of Urinary Retention

Unique Identifier | NMP200/SSM/073 – v05.00
Document Type | Clinical Guideline
Risk of non-compliance | very unlikely to result in harm to the patient/DHB
Function | Clinical Practice, Patient Care
User Group(s) | ADHB only
  - Organisation(s) | Auckland District Health Board (ADHB)
  - Directorate(s) | National Women’s Health
  - Department(s) | Maternity
  - Used for which patients? | Postpartum maternity women
  - Used by which staff? | All clinicians in maternity including access holder lead maternity carers (LMCs)
Excluded | n/a
Keywords | n/a
Author | Midwifery Educator - Physiotherapist and Urogynaecologist
Authorisation
  - Owner | Service Clinical Director - Secondary Maternity Services
  - Delegate / Issuer | Clinical Policy Advisor
Edited by | Clinical Policy Advisor
First issued | April 2008
This version issued | 20 November 2017 - reviewed
Review frequency | 3 yearly

1. Purpose of guideline

The purpose of this guideline is to assist health professionals in bladder care during the postpartum period, with the aim of preventing urinary retention and its long-term consequences within Auckland District Health Board (Auckland DHB).

2. Guideline management principles and goals

Hormone induced reduction in smooth muscle tone decreases bladder tone (hypotonia) during pregnancy and for a period following birth. These changes may persist for days or longer in some women with the risk of over distension of the postpartum bladder (Saultz, 1991, see supporting evidence section).

Vigilant surveillance of bladder function and early intervention where problems exist should prevent permanent bladder damage and long-term voiding problems (Rizvi, 2005, see supporting evidence section).

While all women in the immediate postpartum period have the potential to experience urinary problems, several factors increase the risk:

- Prolonged/difficult labour
- Delay in the second stage
- Assisted birth
- Caesarian birth
- Epidural analgesia, particularly with local anesthetic
- Perineal/vulval trauma
- Over distension of the bladder during/immediately following birth
- Large infant > 4 kg
- English as a second language
- Pain
- Constipation

Aims of care

- To assess bladder function
- To detect any deviation/s from normal
- To carry out timely preventative measures to avoid complications of urinary dysfunction following birth

3. Management

There are two types of urinary retention that can affect a woman in the postpartum period:

- Overt retention: Symptomatic inability to void spontaneously within six hours of birth or removal of IDC
• Covert retention: Non symptomatic increased post void residual volumes after birth or removal of IDC
### 3.1 Overt retention

**POSTPARTUM OVERT URINARY RETENTION PROCEDURE**

**DEFINITION:** SYMPTOMATIC INABILITY TO VOID WITHIN 6 HOURS OF DELIVERY OR REMOVAL OF IDC

- Symptoms:
  - Pain
  - Urgency
  - Hesitancy
  - Straining to void
  - Slow or intermittent stream
  - Sense of incomplete emptying

**STAGE 1: IDENTIFICATION & NON-INVASIVE MEASURES**

- IDENTIFICATION OF ONE OR MORE OF THE ABOVE SYMPTOM and No VOID > 4 HOURS POST DELIVERY or R/O IDC

**BOX 1**

- INSTIGATE NON-INVASIVE MEASURES
  - Analgesia, running water, ambulation, double voiding, provision of privacy, warm shower, ural
  - ENSURE ADEQUATE FLUID INTAKE

**STAGE 2: ASSESSMENT OF VOLUMES + R/O IDC**

**STAGE 3: TRIAL OF VOID**

**DEFINITION:** SYMPTOMATIC INABILITY TO VOID WITHIN 6 HOURS OF DELIVERY OR REMOVAL OF IDC

**NB.** After 2 failed TROC’s refer for medical review

<insert flowchart diagram here>
3.2 Covert retention

POSTPARTUM COVERT URINARY RETENTION
PROCEDURE

DEFINITION: INCREASED POST-VOID RESIDUAL VOLUME AFTER DELIVERY OR REMOVAL OF IDC

IDENTIFIED BY:
NO URGE to void
Ability to void
No symptoms of retention

At 4 HOURS POST DELIVERY OR 4 HOURS POST R/O IDC - ASK WOMAN
“Have you voided?”

“DID YOU HAVE THE URGE TO VOID?” (also ask about amount and flow)

YES
NO

NO FURTHER ACTION

COMMENCE ON 2 HOURLY TIMED VOIDING
ENSURE ADEQUATE FLUID INTAKE (2.5-3L/DAY)
START Fluid BALANCE CHART
MEASURE FIRST VOID

SEND MSU FOR ANALYSIS

VOLUME of void
<200 mL

VOLUME of void between
200 mL - 700 mL

VOLUME of void
>700 mL

CONTINUE TIMED VOIDING 24 HOURS
NO FURTHER ACTION

AFTER 24 HOURS
“Do you have the urge to void?”

“did you have the urge to void?”

NO
YES

NO FURTHER ACTION

NO FURTHER ACTION

MEASURE RESIDUAL VOLUME
Insert IDC

RESIDUAL VOLUME
<150 mL

RESIDUAL VOLUME
>150 mL

Continue timed voiding
Until bladder sensation returns
Organise follow up 1/52

Leave IDC for 24 hours

AFTER 24 HOURS
REMOVE IDC REPEAT PROCESS

STAGE 1: Identification
STAGE 2: Timed Voiding
STAGE 3: Trial of voiding

DEFINITION: INCREASED POST-VOID RESIDUAL VOLUME AFTER DELIVERY OR REMOVAL OF IDC
NO FURTHER ACTION
4. Admission assessment

The initial bladder assessment should include:

- A review of the labour and birth history to detect any risk factors
- History of urological problems
- Bladder palpation
- Check to see if the woman has voided after vaginal birth
- IDC in situ – check that it is draining

An initial assessment should provide information on:

- The presence of any urinary problems
- Risk factors that may contribute to urinary problems

5. First 6 hours post-delivery or removal of IDC assessment

Continue to assess bladder functioning 2 hourly. If unable to void or quantity or flow is abnormal at 4 hours, refer to the postpartum overt urinary retention flowchart (adapted from the WHA Guidelines, 2009).

Notes:

- During the night: If there is no history of urological problems, use opportunities when the woman is awake to check bladder. A woman with a history may require 2 hourly checking
- Onset and progression of urinary retention may be gradual and asymptomatic
- It can take 8 hours for the bladder to regain sensation following epidural analgesia

Assessment:

- Establish by questioning void or no void
- If yes to void, ask the woman if she is experiencing any discomfort or difficulty when voiding
- Check the frequency with which urine is passed
- Ask volume and quality of flow with each void
- Examine the woman’s abdomen for displacement of the uterus and swelling of the lower abdomen
- Palpate the woman’s bladder
- Establish by questioning void or no void

The woman may complain of overt symptoms (symptomatic inability to void spontaneously within six hours of birth or removal of IDC):

- An inability to void
- Increasing lower abdominal pain
- Urgency
• Straining to void
• Involuntary loss of urine
• Voiding frequent small amounts (retention with overflow)

Note: A distended bladder displaces the uterus upward and to the right side. There may also be a painful cystic swelling palpable in the suprapubic region.

If no void at 4 hours either post birth or removal of IDC use supportive measures, such as ambulation, privacy, shower, hands under cold running water, warm flannel over bladder or if necessary appropriate analgesia for pain relief to enhance the likelihood of micturition. Ensure adequate fluid intake and commence Fluid Balance Chart.

Monitor a further 2 hours: (i.e. until 6 hours post delivery or sooner if discomfort)

• If void and volume > 200 mL continue with supportive measures and encourage 2 - 3 hourly voiding
• If no void or volume < 200 mL drain bladder with IDC

When inserting a catheter:

• Use a Foley’s catheter
• Use a strict aseptic technique
• Send CSU to lab
• Document on the Fluid Balance Chart

Note: Using a Foley catheter, instead of an in-out catheter prevents the risk of introducing bacteria into the urinary tract from a second catheterization should an indwelling catheter be required.

A woman may have covert urinary retention (non-symptomatic increased post void residual volumes after birth or removal of IDC):

• Ability to void
• But no urge to void
• No obvious symptoms of retention

Refer to postpartum covert urinary retention flowchart (adapted from the WHA Guidelines, 2009).

6. Urinary retention
Alert obstetric team.

Diagnosed by symptoms and volume drained following insertion of IDC.

• Residual urinary volume of 150 - 700 mL will require IDC for 24 hours
• Residual urinary volume > 700 mL will require IDC 48 hours
Residual volumes of > 1500mls require discussion with the Urogynaecology team

A woman who has a residual volume of more than 700 mL is more likely to require repeat catheterization (Ching-Chung, 2002, see supporting evidence section). After a failed trial of removal of catheter discussion with urgogynae team is required for further management and refer to the ward physiotherapist.

Catheterization rests the over distended bladder allowing it to gain its elastic recoil.

It is advisable to remove urinary catheters early in the day to allow time for careful and regular post catheterization bladder assessment.

7. Removal of catheter (trial of void) management

Encourage 2 - 3 hourly voiding and document voids until normal voiding patterns are established and two measured voids of 200 mL or greater are obtained.

Reassess the bladder as documented and follow the appropriate flowchart for postpartum overt urinary retention or postpartum covert urinary retention (adapted from the WHA Guidelines, 2009).

Document all findings on the Fluid Balance Chart and in the clinical record.

Persistent urinary retention and large urinary residuals will require long term resting of the bladder and management by the obstetric team in conjunction with Urogynaecology.

Note: Bladder scanners are not a reliable measurement of residual volumes in the postpartum woman and are not recommended for use. The automatic calculation is rendered inaccurate because of the volume of the involuting uterus and its tendency to distort the bladder outline (Pallis & Wilson 2003, see supporting evidence section).

10. **Disclaimer**
    No guideline can cover all variations required for specific circumstances. It is the responsibility of the health care practitioners using this Auckland DHB guideline to adapt it for safe use within their own institution, recognise the need for specialist help, and call for it without delay, when an individual patient falls outside of the boundaries of this guideline.

11. **Corrections and amendments**
    The next scheduled review of this document is as per the document classification table (page 1). However, if the reader notices any errors or believes that the document should be reviewed *before* the scheduled date, they should contact the owner or Clinical Policy Advisor without delay.
